Project Name	Rising Waters – Flood Prediction System
Maximum Marks	4 Marks

Empathy Map

Create an empathy map to understand your customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

SAYS "I need to know the flood risk hours before it happens, not after." "The data from different regions never lines up in time." "We can't wait for manual analysis when lives are at stake."	THINKS "If only I had a reliable prediction model, I could act faster." "There has to be a better way than checking multiple scattered sources." "Accuracy matters more than speed — a false alarm costs trust."
---	--

PERSONA NAME:

(Role / User Type):

Ravi Kumar

Meteorologist / Disaster Management Official

DOES Manually checks rainfall, cloud visibility, and	FEELS Anxious about delayed or inaccurate warnings
--	--

seasonal data from multiple sources Coordinates with local authorities to issue evacuation advisories Cross-references current readings with historical flood patterns	costing lives Overwhelmed managing data from multiple regions during monsoon season Relieved and confident when a reliable prediction system confirms risk levels
