

Customer Journey Map

Date	15th July 2026
Team ID	SWTID-2026-3798
Project Name	Rising Waters – Flood Prediction System
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey			
Actions <i>What does the customer do?</i>	• Logs into the web application • Enters current rainfall, cloud visibility, and seasonal data • Submits data for analysis	• Reviews the predicted flood risk output • Compares prediction against historical patterns • Checks model confidence/accuracy score	• Issues evacuation advisory to local authorities • Coordinates resource deployment with disaster relief teams • Monitors situation for updates
Touchpoint <i>What part of the service do they interact with?</i>	• Flask web application input form • Data entry fields • IBM Cloud-hosted interface	• Prediction results dashboard • Risk classification display • Visualization charts	• Alert/notification system • Communication channel to field teams • Reporting module

Customer Thought <i>What is the customer thinking?</i>	• "I hope this data is accurate and up to date" • "This is faster than manual calculations" • "I need this to be simple and quick"	• "Is this risk level high enough to act on?" • "Can I trust this model's accuracy (96.55%)?" • "How does this compare to past flood events?"	• "Did we warn people in time?" • "Are resources being deployed efficiently?" • "What if the prediction is wrong?"
Customer Feeling <i>What is the customer feeling?</i>	<i>Hopeful</i> <i>Focused</i> <i>Slightly rushed</i>	<i>Anxious</i> <i>Cautiously confident</i> <i>Uncertain</i>	<i>Relieved (if handled in time)</i> <i>Responsible</i> <i>Under Pressure</i>

Process Ownership <i>Who is in the lead on this?</i>	<i>Meteorologist / Field Data Officer</i>	<i>ML Model / System (automated)</i>	<i>Disaster Relief Coordinator / Local Authorities</i>
Opportunities <i>How can we improve this stage?</i>	• Enable auto-import from weather APIs • Reduce manual entry errors with validation • Add mobile-friendly data entry	• Add confidence intervals to predictions • Provide plain-language risk explanations • Show historical comparison graphs	• Integrate direct SMS/alert broadcast • Track evacuation completion in real time • Build feedback loop to improve future predictions
